

A precision applicator for selective treatment of individual weeds

Specifically designed for selective treatment of individual weeds, Weedstick is a precision applicator that delivers herbicide directly to the target weed.

- Ideal for selective application of herbicide to individual weeds
- Suitable for use in windy conditions with no risk of spray drift
- User-friendly thanks to its lightweight design
- An economical method of weed control
- Minimal water requirement

Selective weed applicator for individual weed control

The hand-held Weedstick is a precision applicator for the selective application of herbicides to individual weeds and is ideal for treating early stage ragwort.

It puts weedkiller precisely where it is needed - directly on the weed. The Weedstick design eliminates any risk of spray drift so it can even be used on windy days.

When it comes to spot applications or treating sensitive areas like flower beds, the Weedstick has significant advantages over conventional methods of application such as knapsack sprayers. It selectively treats the individual weeds without contaminating the surrounding area.

Easy to use and versatile

The Weedstick is simply placed over the unwanted weed and pressed down to release a dose of herbicide - once for small weeds or twice for large weeds.

The applicator is ideal for use when the ground is moist and the weeds are growing well. The ideal time for treatment is between late spring and late summer.

Specification

Capacity:	160ml
Weight (empty):	0.14kg
Weight (ready to use):	0.30kg
Handle Material:	PVC

1. Handle
2. Liquid Reservoir
3. Press-down Liquid Release Mechanism
